Project Report: Pristine Household Services

1. Project Statement

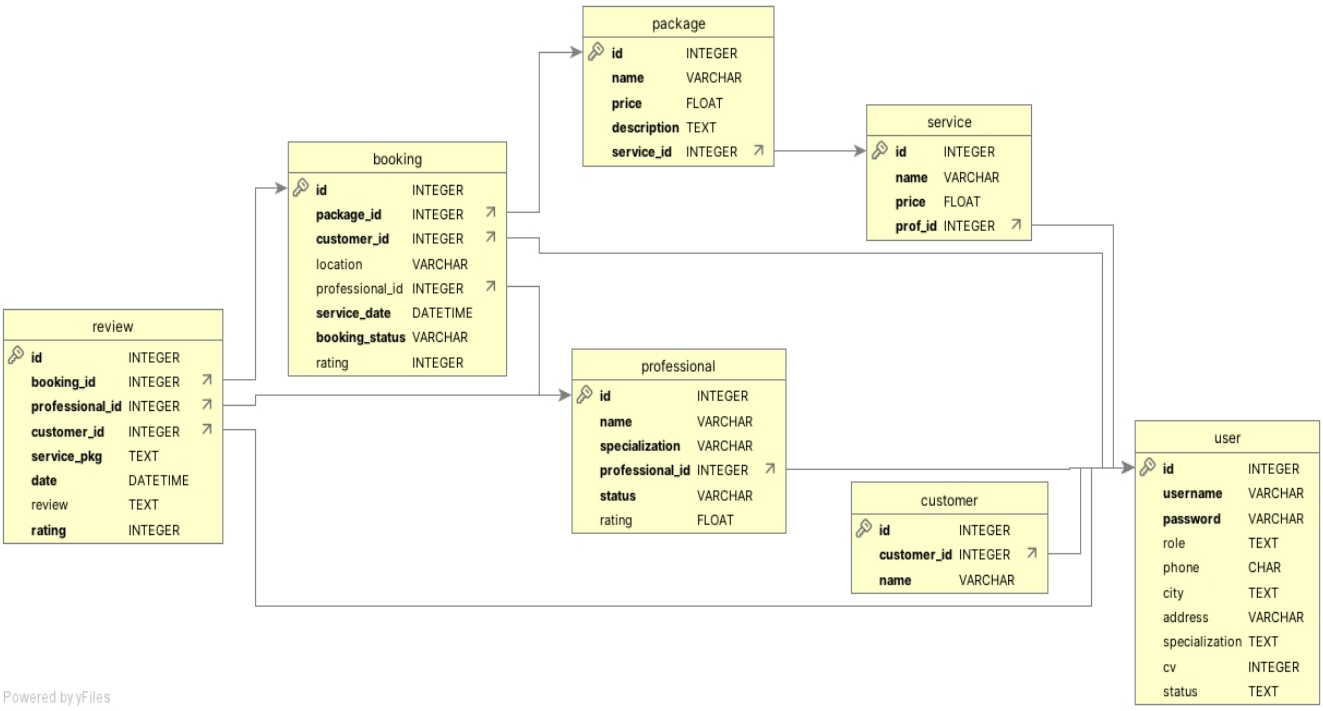
It is a muti-user app (requires one admin and other service professionals/customers) which acts as a platform for providing comprehensive home servicing and solutions.

2. Project Overview

The core functionality of the project revolves around facilitating the booking of services. Customers can search for services, select a professional, and make a booking. The professional can then approve or reject the booking based on their availability. The admin has the capability to manage professionals, services, and track the status of bookings.

3. Technologies Used

- **Backend**: The project uses Python with the Flask framework for the backend.
- **Database**: SQLAlchemy is used to interact with the SQLite database. The database stores information about users, services, packages, bookings, and professionals.
- **Frontend**: The frontend is built using HTML, CSS, and Jinja2 templating to display dynamic content and forms.
- **Routing and Forms**: Flask routes handle requests and pass necessary data to templates. Forms allow customers to submit booking information.
- **Database Model**



4. Functionalities

User Authentication:

- **Registration**: Users can create accounts for the roles of customer, professional, or admin.
- **Login**: After registering, users can log in to their respective dashboards.
- **Role-based Access Control**: Different roles (customer, professional, admin) have specific access to different parts of the application. Admins manage users, services, and bookings, while professionals manage their accepted bookings.

Service Booking:

- **Customer Dashboard**: Customers can view available services, search professionals and book a service. After a booking is made, it enters a "pending" state, awaiting professional approval.
- **Professional Dashboard**: Professionals can view incoming booking requests, and they can approve or reject bookings. Only approved professionals are able to work with customers.
- **Admin Dashboard**: Admins can manage the system by approving , removing professionals or tracking booking statuses.

Booking System:

- Once a booking request is accepted and closed, customers get to submit a review of the service.

Admin Functionality:

- **Manage Services**: The admin can view, add, or remove services & packages that are offered through the platform.
- **Approve/Reject Professional Registrations**: Professionals cannot access the platform without admin approval.
- **Track Booking Statuses**: Admins can monitor the status of all bookings (pending, accepted, or rejected).
